

FERMENTED SHRIMP POWDER - Tim Richardson

Fermented shrimp powder is one of many hygroscopic additives and ingredients available from CC Moore (Thankfully the handy re-sealable CC Moore bags avoid spoilage caused by this beneficial characteristic!). One of the big benefits of hygroscopic substances is the way they suck water into baits to hydrate them; making them perform better and even more digestible!

The exchange of water drawn inside your bait and then leaching back out packed with dissolved bait substances in solution that disperse in the water column really pulls Mr carp to your hook!

Fermented Shrimp Powder, Belachan Powder and Feedstim XP powder, Soluble Fish Protein, Pure Betaine and Liquid Glycerine are other examples but there are very many more.

Why not experiment and see how many in the CC Moore product range you can find to exploit!
